

The Cost of Living in Alaska

Energy prices a large part of 2011's rise in inflation

Anchorage's inflation rate rose from 1.8 percent to 3.2 percent in 2011 — its second-highest increase in the past decade. (See Exhibit 1.)

Energy prices explain much of the difference. They rose 10.8 percent in 2011 and have registered even bigger increases three times over the past 10 years. (See Exhibits 2 and 3.)

Most consumers still spend the largest share of their consumption dollars on housing, though, so housing has a powerful influence on the overall rate. (See Exhibit 4.) Because local market forces strongly influence housing prices, housing can give the consumer price index, or CPI, its local flavor. In contrast, the costs of most other goods and services are largely influenced by national and international trends.

Inflation and comparisons

There are two basic ways to measure the cost of living, which the sidebar on page 5 explains in detail:

1 Inflation in Anchorage

Consumer price index, 2000 to 2011

Source: U.S. Department of Labor, Bureau of Labor Statistics

- *Cost changes in one place over time:* The Anchorage consumer price index is the only CPI for Alaska, so is often considered the de facto measure of inflation for the whole state.
- *Cost differences between places:* A variety of other indexes and studies, such as those by the military and the state discussed later in this article, survey areas to compare their costs to each other and to other places in the nation.

2 Some of the Costs That Went Up

Anchorage consumer price index, 2010 to 2011

*Several of the listed categories overlap; for example, gasoline is part of the increase for both energy and transportation.

Source: U.S. Department of Labor, Bureau of Labor Statistics

Housing is a CPI heavyweight

During most of the past decade, the Anchorage housing market was similar to that of the nation. However, that trend diverged over the past four years. Between 2008 and 2011, Anchorage's CPI housing component increased by 7.6 percent, while the nation's housing prices rose by just 1.3 percent. (See Exhibit 5.)

In 2010, the U.S. housing CPI showed a decrease nationwide, while Anchorage housing costs increased by nearly a percent. These numbers reflect the difference between the tough national housing market of the past few years and the relatively healthy market in Anchorage.

Health care a small component

Health care is not a large enough category to influence the overall Anchorage CPI much, but its increase in prices has been continuous and significant. During the past decade, health care costs in Anchorage have grown by 56.2 percent versus 29.8 percent for the overall index.

CPI can't compare areas

The CPI attempts to measure how much prices rise over time, but it's not designed to say whether one location is more expensive than another. For that, the rest of this article examines a variety of other sources.

How housing compares in-state

Within Alaska, Anchorage homes have the highest average sales price — more than \$100,000 higher than in three other areas in the state in 2011. (See Exhibit 6.)

Higher earnings can offset home costs, though, and this factor makes Juneau the least affordable market. The affordability index in Exhibit 7 takes this earning power into account, producing the average number of wage earners required to qualify for a 30-year mortgage with an average interest rate and a 15 percent down payment.

As in the past, a single family home in the Matanuska-Susitna Borough purchased by Anchorage workers was the most affordable, requiring only 1.03 paychecks to qualify. This phenomenon helps explain the huge flow of commuter traffic between Mat-Su and Anchorage.

For renters, Kodiak Island Borough was the most expensive area for a two-bedroom apartment in 2011, at \$1,231 per month. (See Exhibit 8.) Exhibits 6 and 8 also show the relationship between rental rates and home costs — areas with high rents also tend to have high home prices.

Dillingham's food costs the most

Four times a year, the University of Alaska Fairbanks Cooperative Extension Service posts survey results on the cost of a week's worth of food at home for the average family of four. The Food Cost Survey covers approximately 20 Alaska communities as well as Portland, Ore. (See Exhibit 9.)

Two ways to measure cost of living

1. In a specific place over time

Anchorage is one of 26 cities — and the smallest — where the U.S. Bureau of Labor Statistics tracks changes in consumer prices. Because it's the only CPI in Alaska, it's often treated as the de facto statewide measure of inflation.

BLS goes to great lengths and expense to produce the CPI through elaborate surveys of consumer spending habits. These surveys look at a "market basket" of items, and BLS gives them location-specific weights. The market basket, used in most cost-of-living indexes, is a sample of goods and services believed to best mimic the average consumer or a specific group of consumers. The market basket typically includes housing, food, transportation, medical care, and entertainment.

Workers, unions, employers, and many others pay attention to the CPI because bargaining agreements and other wage rate negotiations often incorporate an adjustment for inflation. The CPI also plays a role in long-term real estate rental contracts, child support payments, and budgeting.

Most Alaskans are affected when the Permanent Fund Corporation uses the CPI to inflation-proof the fund, and nearly all senior citizens are affected when Social Security payments are adjusted each year using the CPI.

The Anchorage CPI is produced twice each year, for January to June and July to December. Information for the latter period and the annual average come out in January of the following year, and this annual figure is typically considered the measure of inflation in Alaska.

2. Differences between places

The other way to assess the cost of living is to look at cost differences between places. For example, is it more expensive to live in Barrow or in Fairbanks? A variety of studies and data sources this article uses compare the costs of living among Alaska communities and other places around the country.

These studies assume a certain consumption pattern and investigate how much more, or less, it might cost to maintain a specific standard of living elsewhere. Some of these data are more comprehensive than others, and because there can be several sources for the same areas, it's important to weigh the strengths and weaknesses of the data sets. Some may better suit a particular need, or in some cases it may work best to cobble together several sources.

Looking at 'the average consumer'

All cost-of-living measures have their shortcomings. No two consumers spend their money alike, nor does any index accurately capture all the differences. For example, the average household in Nome may spend money differently from the average household in Sitka, and they may differ even more dramatically from a family in Los Angeles. An index may or may not take these differences into account, depending on how sophisticated it is.

Consumer spending habits are also continuously in flux. Technology advances, tastes change, and people react differently to changes in prices.

3 Changes in Energy Prices Anchorage CPI, 2002 to 2011

Note: Energy costs are not a separate component — they're included in transportation and affect the other components to varying degrees.

Source: U.S. Department of Labor, Bureau of Labor Statistics

4 Where the Money Goes Anchorage CPI, December 2011

Source: U.S. Department of Labor, Bureau of Labor Statistics

Its market basket, or sample of goods and services intended to best mimic the average consumer, includes items with minimum levels of nutrition at the lowest possible cost.

The 2011 survey showed groceries cost the most in Dillingham at \$354.72 per week. The same items would have been just \$141.95 in Anchorage, and \$115.62 in Portland.

The Cooperative Extension survey has a number of strengths. It covers a wide area and has been consistently produced since 1984. It's also specific — its Web site publishes food costs for different family configurations and for individuals at different ages.

In addition, the complete survey includes information on utilities, fuel, and lumber prices.

One limitation of this survey is its restriction to relatively small components of the cost of living. The survey also assumes an identical market basket in all communities so it can't make allowances for buying habits, which may differ drastically among areas. For example, many items that can be purchased in urban Alaska are not available in rural communities.

Like all cost-of-living surveys, its market basket can't account for the possible substitution of subsistence-harvested meats, berries, and other products.

Calculating index changes

Movements of the indexes from one period to another are usually expressed as percent changes rather than index points, because index points are affected by the level of the index in relation to its base period. The following example illustrates the computation of index points and percent changes.

Index Point Change

Anchorage CPI, 2011.....201.4
Less CPI for previous period, Anchorage 2010.....195.1
Equals index point change.....6.3

Percent Change

Index point difference.....6.3
Divided by the previous index.....195.1
Equals.....0.032

Results multiplied by 100.....0.032 x 100
Equals percent change, Anchorage CPI 2011.....3.2

How much would \$1,000 in 2000 buy in 2011?

The Anchorage CPI can answer the often-asked question, "How can I take a dollar amount from some earlier year and make it current with today's dollar value?" Use the simple equation below.

2011 Anchorage CPI (most recent, Exhibit 5).....201.4
Divided by 2000 Anchorage CPI (also in Exhibit 5).....150.9
Equals.....1.335
Then multiply 1.335 (\$1,000 in the year 2000 dollars) = \$1,335
in current or 2011 dollars.

See labor.alaska.gov/research/cpi/inflationcalc.htm for an inflation calculator. The calculator can also deflate dollars to an earlier year's value.

5

Rural areas have high fuel prices

The Alaska Department of Commerce, Community, and Economic Development conducts a detailed semiannual survey of heating fuel and gasoline prices in 100 communities. (See Exhibit 10.)

With few exceptions, smaller rural communities pay significantly higher fuel prices than urban areas, and fuel costs are always highest in remote communities off the road system. In 2011, the highest prices were in the Interior village of Hughes, where heating fuel was \$9 per gallon.

Average heating fuel prices increased in all communities, except the Northern region, from \$4.98 in January 2011 to \$5.71 in January 2012. Gasoline prices followed a similar pattern.

Alaska's high-cost cities

The Council for Community and Economic Research publishes the ACCRA cost-of-living index each quarter as well as an annual report. Its survey covers more than 300 U.S. cities, including Anchorage, Fairbanks, Juneau, and Kodiak.

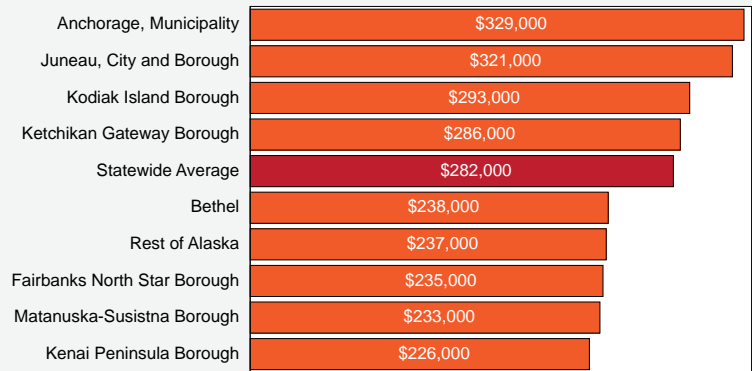

The study examines costs for 57 items and classifies results in cost categories such as groceries, housing, utilities, transportation, health care, and miscellaneous goods and services, with the average U.S. city's costs indexed at 100.

ACCRA styled its consumption pattern after a professional household in the top income quintile. The weights are significantly different from the consumer price indexes and include far less detail. They also exclude state and local taxes — a potentially major omission.

The 2011 data place the costs of living in Anchorage, Fairbanks, Juneau, and Kodiak well above the national average. Juneau's cost-of-living was highest at 139.0, or 39 percent above the U.S. average. Anchorage weighed in at 130.6, Fairbanks at 137.0, and Kodiak at 127.6. (See Exhibit 11.)

According to ACCRA, high costs of living distinguish Alaska cities from most other places in the nation. Alaska and New Jersey were the only states where all cities' indexes topped 125. Alaska cities have plenty of company, though. Nine other U.S. cities' costs topped Juneau, and they were mostly large metro areas in California and around New

York City. Manhattan topped the list at 218.8.

Other cities with higher costs than Juneau included the Washington, D.C., area; Stamford, Conn.; and Honolulu, Hawaii. Altogether, outside of Alaska, 26 cities topped 120. The most affordable city in the nation was Harlingen, Texas, at 81.0.

Anchorage utilities cost less

Housing in Alaska cities was not the only above-average cost component. Expenditures in most categories were over the U.S. average — with one exception. Anchorage utility costs were just 98.2 percent of the national average.

Most Anchorage residents heat their homes with natural gas, which has continued to contain costs. This was in stark contrast to Fairbanks' utilities index value of 211.5 — the single largest differential among all surveyed cities in the nation as well as in any category for Alaska cities. Honolulu's utility costs were a distant second at 161.9.

As a subcategory in housing, the Bureau of Labor Statistics tracks changes in the price of natural gas or what they call "utility-piped gas services." The price of natural gas in Anchorage is much more complex

³Barrow uses natural gas as a source of heat.

Source: Department of Commerce, Community, and Economic Development, Current Community Conditions: Fuel Prices Across Alaska, January 2012 Update

than those of heating oil and gasoline, which closely track with changes in the price of crude oil.

As with many utilities, the State of Alaska regulates the price of natural gas, which is often indexed to natural gas prices in the Lower 48. Seasonality and storage are among a variety of costs built into the price, and contracts and spot purchases from gas suppliers can further affect natural gas prices.

Overall costs highest in Kotzebue

In 2009, the state released the 2008 Alaska Geographic Differential Study, intended to adjust salaries by location for state workers. It remains the most comprehensive state cost-of-living study and though it's a few years old, its sophistication and broad geographic and category coverage make it the default, almost one-stop reference for all cost-

of-living data needs in the state.

The differential study is highly detailed, covering all areas of the state and many communities, each with their own market basket and weights.

Kotzebue was the highest-cost area at 1.61, and most off-the-road-system towns were at 1.30 or higher. (See Exhibit 12.) Roadless communities connected by the ferry system were next highest,

and included Kodiak, Cordova, Juneau, and Sitka. Regions with lower costs than Anchorage were areas with cheaper housing, such as Glennallen and Mat-Su.

Military data exclude housing

The Department of Defense produces a cost-of-living index called OCONUS for all its overseas locations, including Alaska and Hawaii. Its strengths

Minnesota	1.14	Wisconsin	1.06
Mississippi	0.88	Wyoming	0.89
Missouri	1.02	Washington, D.C.	1.04
Montana	0.96		

Note: The national average is set at 1.0

Source: U.S. Army Corps of Engineers, revised March 2012

are its broad geographic coverage — 25 areas in 2011 — and frequent updates. (See Exhibit 13.)

The military found the highest prices in Barrow, Bethel, Nome, and Wainwright and the lowest in Wasilla and Anchorage. These results mostly line up with other data in this article, but one difference is that OCONUS does not include housing. Because the military disburses a housing allowance, the adjustment is based on “spendable” income: income minus housing expenses, taxes, savings, life insurance, gifts, and contributions.

Corps tallies construction costs from state to state

The U.S. Army Corps of Engineers is involved in civil works projects around the nation, and as a byproduct it assembles data on construction costs. Corps indexes are used to adjust these costs on a state-to-state basis. (See Exhibit 14.) Alaska tops the list at 1.19, and though this is a narrow category, it matches up with a number of other indexes.
